Claude Code and Claude Cowork

One capability, two faces: *an AI agent that works on your computer, in your files* — instead of in a chat window.

CLAUDE CODE

Born in the terminal, built for engineers.
Builds software.

COWORK

Lives in an application, built for non-techies.
Does everything else.

Both: reads your files → does the work → shows you the result

Chat vs. agent

Chat window	Cowork / Claude Code
You copy-paste context in	It opens your files itself
It gives you text back	It produces the actual file
You do the work	It does the work; you review
Forgets your project	Lives in your project folder

Your work lives in files

If your work can be put in a folder, Claude can work on it.

Getting Started

1

The Claude app

Desktop (Mac/Windows). Pick “Cowork” in the message box.

2

A paid Claude plan

Cowork is on all paid plans — Pro, Max, Team, Enterprise.

3

A folder with real work

Start with one recurring chore. Transcripts are perfect.

Coding act later: same app's “Code” side — Terminal optional (but most prefer it).

Talk with Your Meetings

From this morning's standup → sprint-ready stories

THE SETUP *This meeting ended five minutes ago — already in Product Forge CRM. Minute 6: “Acme keeps asking for visibility into account health.”*

Pull today's DEMO – Talk Test from the CRM. What did Acme actually ask for? Before writing anything — what questions do you have for me? Then: user stories, Given/When/Then acceptance criteria, open questions.

Real work, no code

What people whose titles don't say “engineer” do with it all day

02

Anthropic's own non-engineers

GROWTH MARKETING

Hundreds of ad variations in minutes

An agentic pipeline + Figma plugin generating ~100 variants by swapping headlines.

LEGAL

Prototyped a “phone tree” for legal routing

Zero developers requested.

DATA SCIENCE

Full React dashboards

“Without JavaScript knowledge.”

PRODUCT DESIGN

Edge cases mapped during design

Error states found before engineering ever sees the work.

What I do with Claude Code and Cowork

- Have discussions with my meetings
- Generate user stories, PRDs, and specs from meetings
- Parallel-execute massive bodies of work (competitive research)
- Automate my day-to-day (custom meeting summaries)
- Automate important tasks (automatic receipt processing)

Use case: documents & decks

Folder of past work

Ask for the next one “in the style of the last three”

On-brand draft, every time

“Now, essentially every presentation I make is with Claude Code, and I rarely use other tools such as PowerPoint.”

— Eivind Kjosbakken, Towards Data Science

One folder of everything you've made = taste + brand memory

Use case: find anything, anywhere

“Where did we land on the pricing change?”

The end of app-hopping archaeology.

What's an MCP?

MCP = Model Context Protocol — the open standard that plugs AI into your tools.

Thousands of valuable connections

One click each, in the Claude directory. Anything not listed? That's what MCP is for.

Enable per session: + → Connectors → toggle on

MINI-DEMO

Mail + calendar, conversational · 90 seconds

“Look at my calendar for Monday. Give me a summary of my day (just meeting titles in a list). For the 5:30pm standup, pull our most recent conversation from the CRM and give me a summary of what Luis was going to focus on next.”

Two tools, one conversation. Every connector you add compounds like this.

How we run Product Forge

PRODUCT FORGE CRM · MCP

Our product. Every call I have, in one place — in person (pocket device) + online (Fathom). I can just talk to my calls.

EMAIL + CALENDAR MCPS

Mail and schedule, conversational.

FOLDERS, EVERYWHERE

One per project, per recurring job.

PRODUCT FORGE DOCS

Our product. Markdown files, synced to the cloud — one filing cabinet the agent and I share.

Agents: the work that happens without me

Standing agents I've built on Product Forge.

They run when a new call lands — not when I remember to ask.

Each one has a job:

mine every call for customer needs · check what we can and can't fulfill · roll signals up into patterns across every conversation

I don't run them. I read their output — it lands in Slack.

The screenshot shows the 'FoundorOS / Agents' interface. At the top, there are tabs for 'Agents' and 'Settings'. Below this is a section titled 'Agents' with a '+ Add Agent' button. The main section is titled 'Scheduled Tasks' and contains a table with the following columns: NAME, TYPE, SCHEDULE, NEXT RUN, ACTIVE, and ACTIONS.

NAME	TYPE	SCHEDULE	NEXT RUN	ACTIVE	ACTIONS
Identify User Stories	prompt	When meeting labeled [input box]	on event	Active	Edit Runs Delete
KB Strategist	sonnet	/workspace/agents/KB_...	8507739243	Active	Tasks Edit Delete
KB-Admin	sonnet	/workspace/agents/KB_...	8507739243	Active	Tasks Edit Delete
KB-Requirements Gatherer	sonnet	/workspace/agents/KB_...	None	Active	Tasks Edit Delete
Strategy Coach	sonnet	/workspace/agents/Str...	8507739243	Active	Tasks Edit Delete

What lands in Slack

KB-Strategy APP 9:10 PM

New call processed — Acme Logistics · Customer Working Session · Jul 27, 2:00 PM (47 min) __Participants: Karen Vogel (Dir Ops), Dave Brubaker (IT), Miguel Santos (VP Ops) · Marcus Webb

3 signals extracted:

1. Account health visibility · cannot-fulfill · product_gap
"I don't need new data. I need the platform to look at the data for me and tell me which accounts are drifting." — Karen Vogel Customer wants a per-account composite health score (volume trend, on-time, margin, last activity) with worst-first ranking and rep filtering. Third consecutive call raising this need.
2. Scheduled exports to BI · can-fulfill (partial) · implementation_gap
"A saved filter I still have to remember to run is a chore with a bookmark." — Dave Brubaker Saved filter sets exist today (setup scheduled with CS). Scheduling/automation of the export does not — flagged as the unmet remainder.
3. Renewal-risk alerts · cannot-fulfill · product_gap
"The account going quiet in May should have set off a ninety-day alarm somewhere." — Karen Vogel Alert when an account inside its renewal window shows falling engagement. Delivery preference: Slack or email.

Rolls up to: Account health visibility (5 signals · 4 customers) · Scheduled exports (3 · 3) · Renewal-risk alerts (new this week) 🔗 View call + full signals in Product Forge CRM

Message @kb-strategy

+ Aa 😊 @ | 📎 🗑️ | 🗑️

Real output, in the channel where the team already lives.

From call to Slack — immediately after a call

No step needs me. That's the point.

**If you could automate anything
coming out of a meeting...**

...what would you automate?

The six-report day

Six subagents, in parallel — each researched its slice and wrote its own spec.

Me: reviewing six drafts instead of writing six documents.

Subagents, explained

A worker with its own clean desk.

Claude spins up a copy of itself with a separate context — it reads what it needs, does one job, reports back a summary.

Your conversation stays clean.

The six-hour transcript never floods the main session — only six finished specs come back.

You just ask.

No setup, no configuration. Delegation is a sentence.

“Spin up a subagent for each of the six reports. Have each one read the transcript and write its spec as a separate document.”

REACH FOR THEM WHEN

big inputs · parallel work · a fresh-eyes review of finished work

Four subagents, four connectors, one prompt

“Before my 10am with Acme: spin up four subagents — one each for Gmail, Calendar, Slack, and the CRM. Each one pulls anything about Acme from the last two weeks. Combine what they find into one brief.”

The pattern: the folder is the workflow

- One folder per recurring job — client, sprint prep, board decks...
- A context doc: who you are, what good looks like
- Outputs stay in the folder, so every run builds on the last

“Not a chat you lose. A workspace that compounds.”

A day in the life, by role

PRODUCT MANAGER

- Competitive analysis from a folder of rivals' pages
- PRDs & Jira-ready tickets from meeting-note chaos
- Prototypes before eng kickoff

SCRUM MASTER

- Sprint summaries from a Jira/Linear export
- Retro themes clustered from raw feedback
- Working agreements drafted in minutes

PRODUCT OWNER

- Backlog deduped & de-staled
- Big stories split with AC intact
- Consistency checks across the whole backlog

Claude *Code*

You can make software too.

03

DEMO 2

Build one of the six

WHAT WE'RE BUILDING Find the file called “[user-stories.md](#)” and use its contents to build a mockup of the page it describes as a single html file. Place it in the same folder and call it example.html

Build it · Break it · Ask it to explain itself

Vibe coding, responsibly

THE MINDSET

- Plan before building — ask: “What questions do you have before we get started?”
- Iterate in small steps
- Show it screenshots of what's wrong

THE GUARDRAILS

- It proposes, you approve
- Diff view: see every change first
- Checkpoints & rewind: Ctrl-Z for the whole session
- Plan mode: think first, touch nothing

Prototype > requirements doc

THE OLD WAY

20-page PRD → 3 weeks of clarifying meetings

THE NEW WAY

Clickable prototype → 1 meeting

A working prototype is the highest-bandwidth requirements document possible.

What it's not

Prototypes ≠ production. Ship-to-customers still needs engineers.

It's confidently wrong sometimes. Review everything with your name on it.

Give it a way to check its work. An example of “good,” a doc to compare against.

Your data policies still apply. Ask before pointing it at sensitive folders — or connectors.

Teach it once

From “great session” to “great system”

04

Memory: write it down once

In Cowork: folder instructions — context attached to your folder, which Claude can even update itself — plus Projects with their own memory.

In Claude Code: a file literally named CLAUDE.md.

Either way: a plain-English doc it reads every single time.

```
product-context.md
```

```
# About this product
- B2B logistics tool; users are ops managers

# How I like things
- Stories: "As a...", AC in Given/When/Then
- Tone: plain English, no filler
- Always end with open questions
```

Skills: your workflows, on tap

A skill = a saved workflow in a markdown file.

Invoke it by name: `/user-story`

Works in Cowork and Claude Code.

Written in English, not code.

Pro tip: generate this. Don't write it.

```
SKILL.md
```

```
name: user-story
description: Turn a call or request
  into stories + AC
---
1. Read the source (CRM call,
  email, or file)
2. Ask me: "What questions do you
  have before we get started?"
3. Write stories, Given/When/Then
4. End with open questions & risks
```

The upgrade ladder

When this happens...	Add this
You correct it the same way twice	A line in your Project instructions / CLAUDE.md
You paste the same playbook a third time	A skill (/your-workflow)
You keep copy-pasting from another app	A connector (MCP)
A chore happens every week on schedule	A scheduled task — runs in the cloud, even with your laptop closed

Manage Your Context Window

Everything in a session — the files it reads, what you say, what it makes — lives in one working memory. It fills up. And a full memory gets sloppy.

One task per session

Watch for drift — forgotten instructions, repeated mistakes

Then: `/compact` or `/clear`

Slash commands: the session controls

/compact

Squeeze the session down to what matters — and it takes instructions: “/compact focus on the API changes”

/context

How full is the window right now — and what's filling it. Diagnose before you compact or clear.

/clear

Fresh start between unrelated tasks. The single highest-value habit on this slide.

/rewind

Time-travel: restore the conversation, your files, or both to any earlier checkpoint.

/

Type it alone to browse everything — every command, plus your own skills.

Five habits of people who get great results

- 1 Be specific — name the file, the format, the audience
- 2 **Start with: “What questions do you have before we get started?”**
- 3 Give it a way to verify — examples of “good,” a doc to check against
- 4 Course-correct early — interrupt, redirect, or rewind; don't ride a bad run
- 5 Treat it as a thought partner, not a vending machine

Tomorrow morning

- 1 Open the Claude app → choose Cowork (any paid plan; no terminal)
- 2 Point it at a folder for one recurring chore; drop in 2–3 real files — start with a transcript
- 3 Write a 10-line context doc: who you are, what good looks like. Ask Claude how to install as [CLAUDE.md](#). Do the same with your first skill.
- 4 Ask: “Read this folder. What questions do you have before we get started? Then produce [the thing].”
- 5 Keep the outputs in the folder. Next week, run it again — it'll be better.

The Experience Is Yours to Create

86%

report gains in the speed of their work

57%

say AI has made their skills more valuable

...and the heaviest automators are the most optimistic.

Iterate your ecosystem.

You get to experience all of it — and make your work a little better every week.

Help us learn

PRODUCT FORGE DOCS

The markdown-in-synced-folders
filing cabinet you saw today.

PRODUCT FORGE AGENTS

The standing agents that turned
calls into Slack posts — while
nobody was driving.

CUSTOMER FEEDBACK WIDGET

A feedback widget for your
website — input aggregated into
patterns, not a queue of tickets.

*We're opening all three to 20 people who'll work this way and tell us what's broken.
Not a launch. Not a pitch. We want to learn with you.*
